The Human Footprint ver. 2

Global

Robinson Projection

The Human Footprint Index

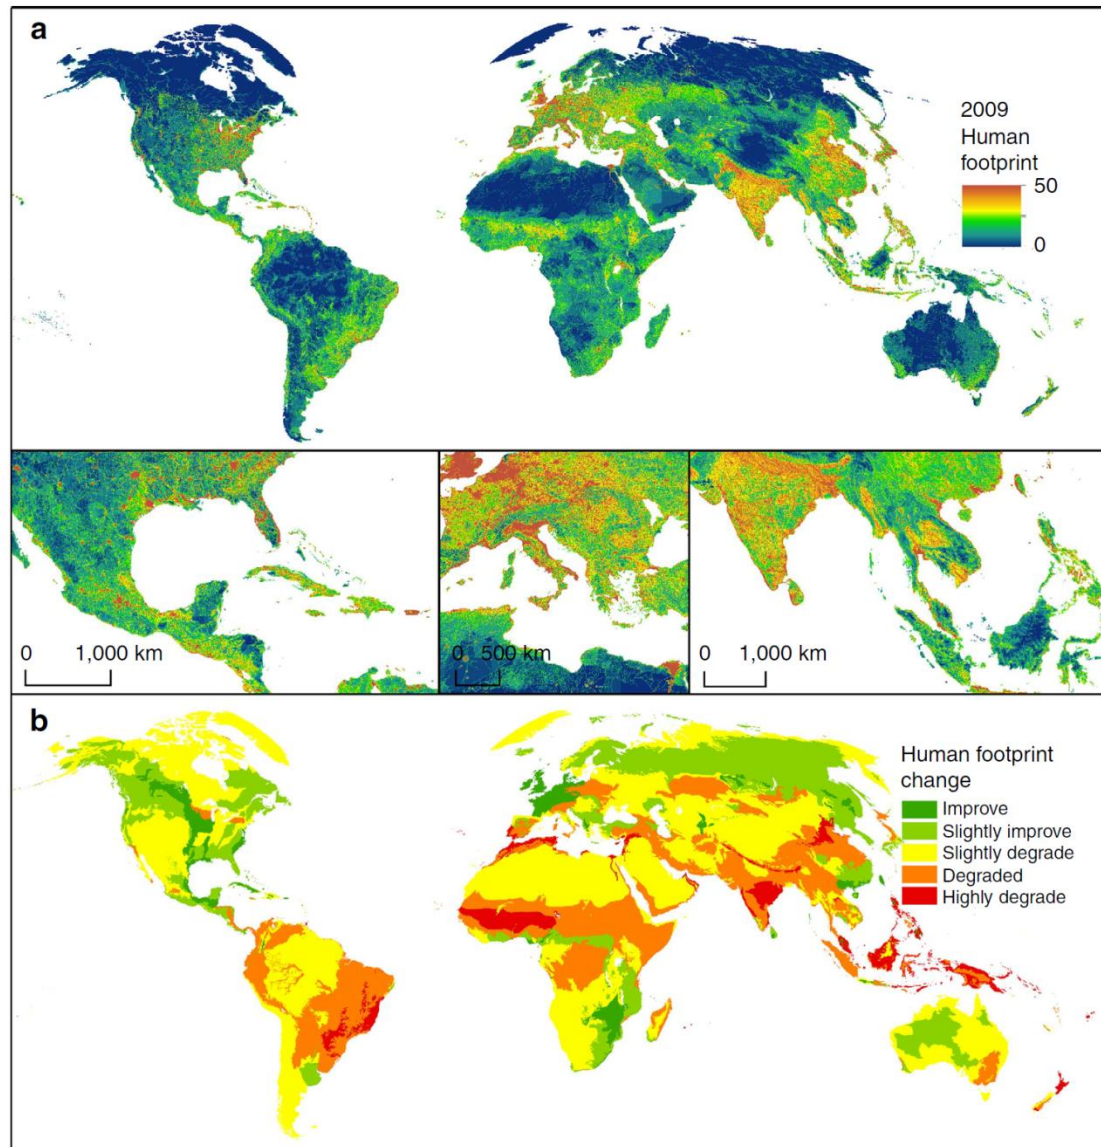

The Human Footprint Index (HF) expresses as a percentage the relative human influence in each terrestrial biome. HF values range from 0 to 100. A value of zero represents the least influenced - the "most wild" part of the biome with value of 100 representing the most influenced (least wild) part of the biome.

Figure 1 | Maps showing the current state and recent change in the global human footprint. (a) The global human footprint map for 2009 using a 0–50 cool to hot colour scale, and (b) absolute change in average human footprint from 1993 to 2009 at the ecoregion scale⁷⁴. Data on human footprint change are summarized by ecoregions to allow for interpretation of broad patterns. Inset panels in **b** show focal regions that span the full breadth of the human footprint pressure scale.

The World is Changing

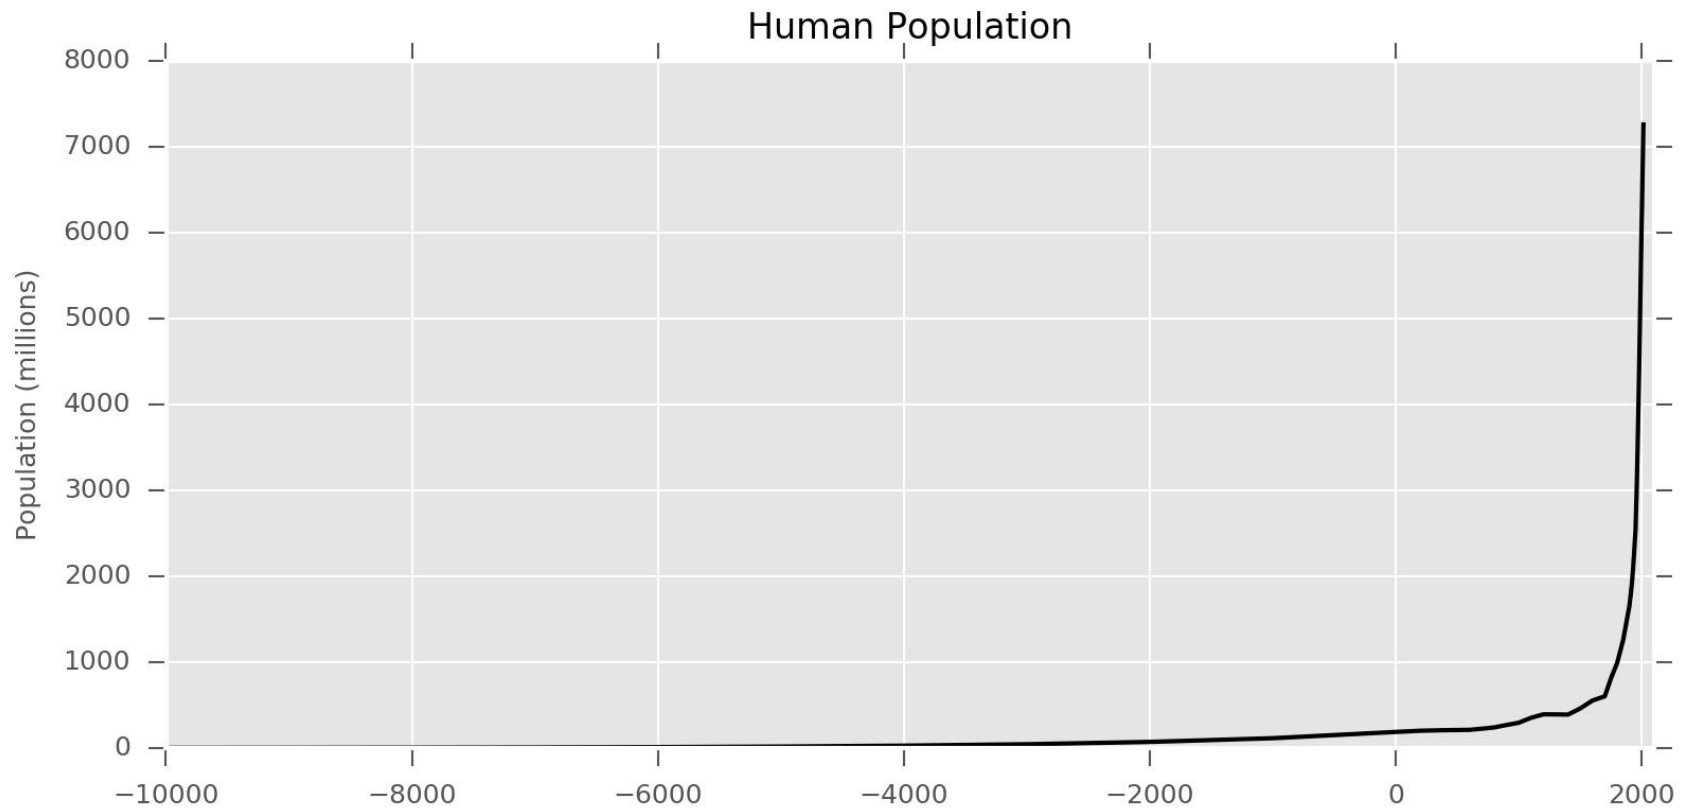

World	1993	2009	Change (%)
Human footprint (global average)	5.67	6.16	+9%
Population	5.53 billion	6.84 billion	+23%
Economy (GDP, constant 2005\$, adjusted for PPP)	32.4 trillion	81.9 trillion	+153%

Human footprint change

Three global trends

1. Human Population

(a) World Bank 2016, (b) UN Population Division 2015 , (c) KC and Lutz 2017

Figure 2. Average annual rate of population change, major areas: 1950-2050

Demographic Transition

Our World
in Data

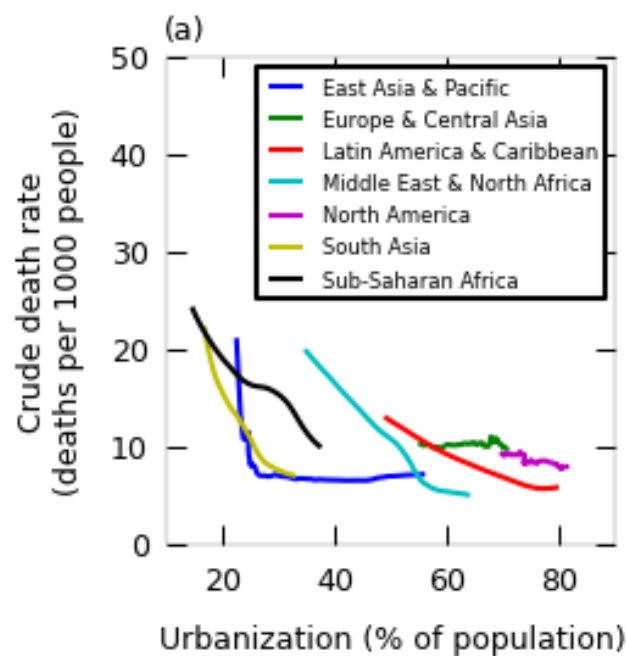

Birth rate	High	High	Falling	Low	Very low
Death rate	High	Falls rapidly	Falls more slowly	Low	Low
Natural increase	Stable or slow increase	Very rapid increase	Increase slows down	Stable or slow increase	Stable or slow decrease

Demographic Benefits of Cities

- Urban people have fewer kids than rural folks
- Because
 - Better access to healthcare and family planning
 - Lower child mortality
 - Higher incomes from non-farm work
 - Women have more power
 - Higher costs of raising kids
 - Better outcomes from education investment

2. World Economy

Income inequality

Declines in extreme poverty

FIGURE 0.1 Global and regional poverty rate estimates for 1990, 2011, and 2030

Percent

Source: PovcalNet is the online tool for poverty measurement developed by the Development Research Group of the World Bank. See <http://iresearch.worldbank.org/PovcalNet/index.htm> for additional information and data.

Note: The 1990 and 2011 estimates are based on Household Budget Surveys, and 2030 is a projection based on a reference scenario. See the discussion on scenarios in the Report Card.

a. Refers to the numbers that are provisional because survey coverage is less than 50 percent of population in the region.

Economic benefits of cities

- Urbanization drives economic growth
 - Concentrates workers and firms
 - Increase worker productivity
- Agglomeration effects
 - Economies of scale (bigger markets, shorter distances)
 - Specialization of labor (more competition, greater rewards to specialization)
 - Better infrastructure at lower per-capita costs
 - Improved learning and innovation

3. Urbanization

Why urbanize?

- People move to town for opportunity
 - Opportunities for
 - Better jobs
 - Better income
 - Better education
 - Better outcomes for themselves and for their kids
- ... if and only if cities are safe, healthy and attractive places to live

A theory of biodiversity conservation in the Anthropocene

What are the conditions for lasting biodiversity conservation?

- Global population stabilization
- End of extreme poverty
- Society dedicated to improving the environment

through...

Well-functioning, attractive, desirable, sustainable
cities
